**Solutions with
Aluminum Profiles**

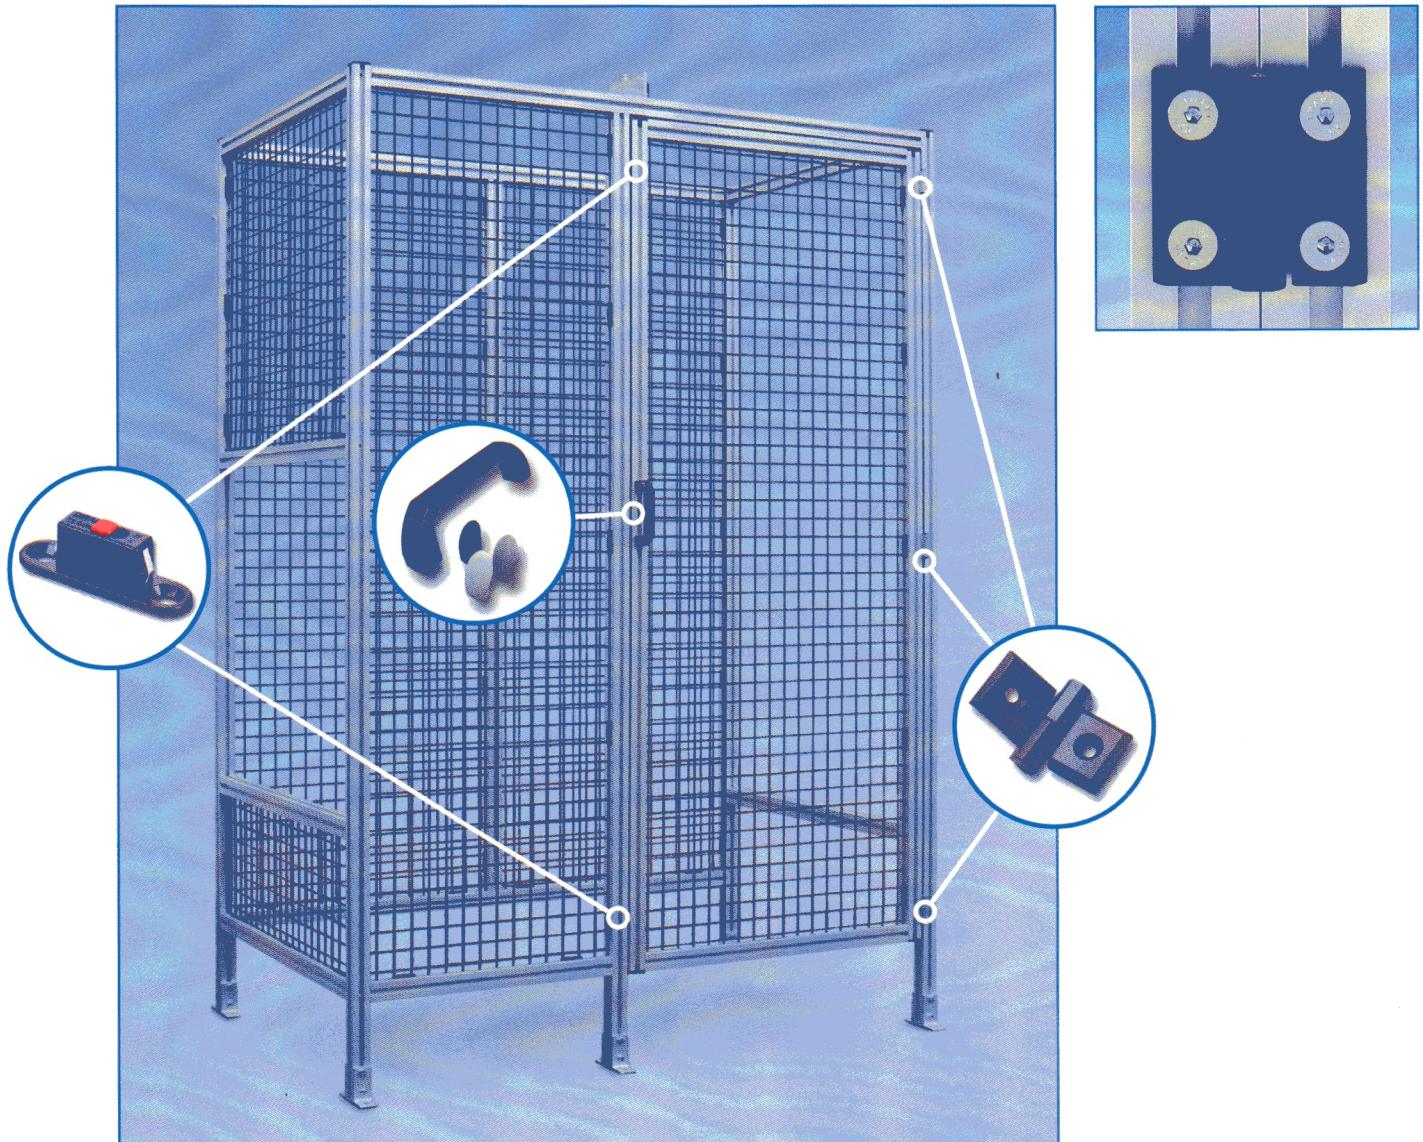

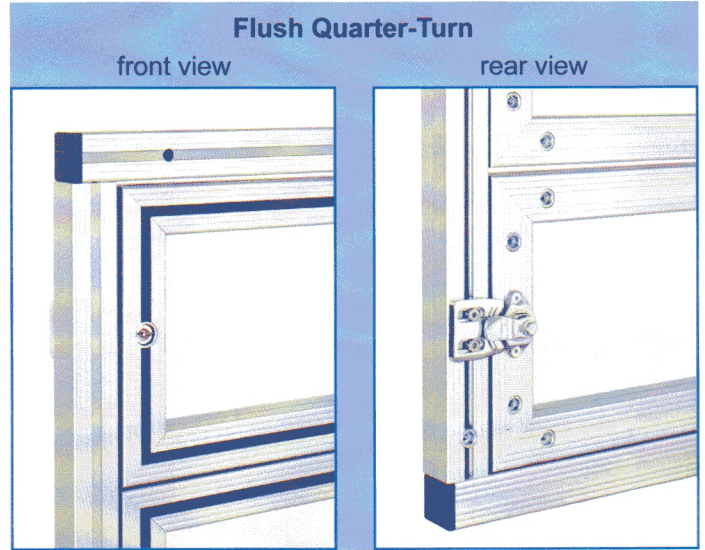

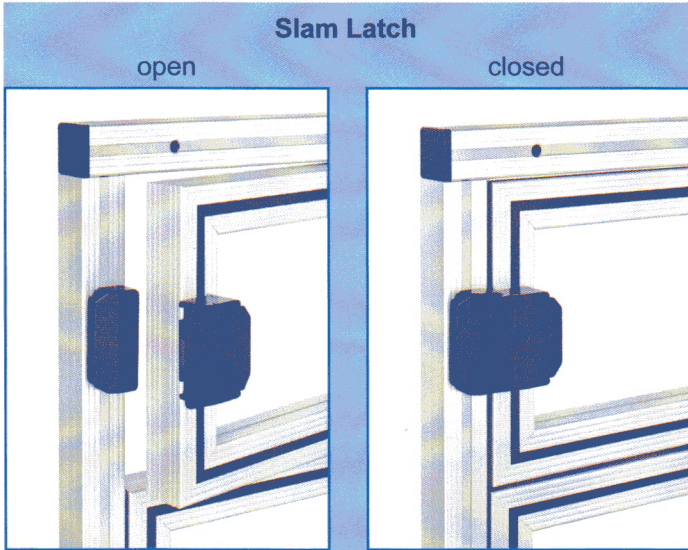

Aluminum Profiles

Aluminum profiles are components that can be used very flexibly to quickly set up new production facilities, such as for machine construction, or to redesign such facilities.

Profile technology has thus established itself for applications such as safety guards, machine base frames

or conveyor system elements, because they can be set up quickly, and easily changed at a later time.

This setup flexibility also requires versatile fittings that can be used to quickly and easily open or close access doors and flaps.
